

MALLIKARJUN GAJJI

Senior Backend Engineer | Distributed Systems & Platform Engineering

Bangalore, India | +91 95383 08127 | g.mallik.dev@gmail.com | [linkedin.com/in/themallik](https://www.linkedin.com/in/themallik) | github.com/zmallik

SUMMARY

Backend engineer with 11 years of experience building high-throughput distributed systems and SaaS platforms. Owns a revenue-critical pipeline processing 10K+ regulated submissions per month, reduced production incidents by 95%, led cross-team monolith to microservices decomposition, and designed an org-wide platform adopted by multiple product teams.

TECHNICAL SKILLS

Languages: Java (primary), Go, Python, SQL, Bash

Backend: Spring Boot, gRPC, REST, Flask, JUnit, Mockito, event-driven architectures

Distributed Systems: Kafka, Redis, Elasticsearch, microservices, idempotent workflows, retry-safe architecture

Data Stores: MySQL, MongoDB, DynamoDB - schema design, query/index optimization, data integrity, concurrency control, replication & sharding

Cloud & Infra: AWS (Lambda, EC2, S3, SQS), GCP, Kubernetes, Docker, Jenkins

Observability & Reliability: Structured logging, distributed tracing, metrics/alerting, RCA, on-call leadership

Leadership: Technical design reviews, architecture decision records, cross-team collaboration, mentorship & hiring

PROFESSIONAL EXPERIENCE

Tekion Corp - Senior Software Engineer

Jan 2021 - Present

Bangalore, India | Automotive retail SaaS platform serving OEMs and dealerships globally

- **Technical owner of a revenue-critical reporting platform** processing 10K+ monthly regulated submissions; co-designed end-to-end architecture and drove the platform from incident-prone to a stable, auditable production service.
- **Drove a 95% reduction in critical production incidents** through systematic RCA, targeted reliability investments (validation, audit logging, idempotency, replay safety), and raising automated test coverage to 80%.
- **Led monolith-to-microservices decomposition** for a core business domain - partitioned services along bounded contexts, designed contract-first gRPC/REST interfaces, and coordinated rollout across multiple teams with zero-downtime cutovers.
- **Designed core service primitives** for high-volume write-heavy workloads; engineered database-level locking, optimistic concurrency control, and idempotent workflow patterns to preserve data integrity under retries, partial failures, and concurrent writers.
- **Delivered database and runtime performance wins** by profiling hot paths and rewriting MySQL query/index plans, materially cutting p99 latency and stabilizing throughput on revenue-critical workloads.
- **Technical design lead for an org-wide PDF generation service** (AWS Lambda + Typst + Kafka) - designed rendering pipeline, backpressure handling, and horizontal scaling model; now used by multiple product teams.
- **Mentor and force-multiplier across the engineering org** - guide senior and mid-level engineers on distributed systems design, code review, and production readiness; lead architecture reviews and partner with leadership on technical strategy and hiring.
- **Incident commander and production steward** - own on-call rotations, drive post-mortems, and translate operational pain into durable platform investments.

Tekion Corp - Software Engineer

Oct 2019 - Dec 2020

Bangalore, India

- **Delivered a reporting module** with Excel export and parameterized queries, enabling business users to self-serve on operational data and eliminating a recurring engineering ticket class.
- **Shipped the Release Notes / Knowledge Base platform** from design through launch; reduced inbound support volume by increasing feature discoverability across enterprise customers.
- **Primary escalation engineer** for production incidents; established patterns later formalized into SOPs.

Honestbee - Software Engineer

Jul 2018 - May 2019

Bangalore, India | On-demand delivery & e-commerce platform (Southeast Asia)

- **Designed and shipped a payroll computation service** that ingested delivery telemetry streams and produced daily payouts, eliminating manual reconciliation for operations and providing an auditable pipeline.
- **Integrated third-party payment gateways** (Stripe, CyberSource), expanding supported channels and hardening checkout against partial-failure and duplicate-request scenarios.

Iamplus Electronics - Software Engineer

Bangalore, India | Voice-first consumer hardware & conversational AI startup

- **Built voice-enabled conversational services** (restaurant reservations, weather, utility skills) on top of third-party APIs, handling intent parsing, slot-filling, and graceful degradation under upstream failures.
- **Introduced caching layers and response-shaping optimizations** that materially reduced end-to-end latency and improved conversational UX on resource-constrained voice devices.

SELECTED TECHNICAL IMPACT

- **Reliability:** 95% reduction in critical production incidents on a revenue-critical service.
- **Scale:** Platform ownership of a pipeline handling 10K+ monthly submissions with strict auditability.
- **Architecture:** Led monolith-to-microservices decomposition across a domain spanning multiple teams.
- **Performance:** Runtime profiling and MySQL query/index rewrites delivering measurable p99 latency reductions.
- **Leverage:** Designed an org-wide PDF generation platform adopted by multiple product teams.
- **People:** Mentor across seniority levels; contributor to architectural decisions and hiring.

EDUCATION

Indian Institute of Technology (IIT) Guwahati

B.Tech, Mathematics & Computing

Jul 2011 - May 2015
